EXERCISE # 5.1A: Identifying Who are Eligible for IPT

Identify who among the following are eligible for IPT and explain:

1. Nesrin, 4 years old, is the daughter of a bacteriologically confirmed TB case. She has no signs or symptoms of TB and her TST is 3 mm.

2. Vicky, 3 years old, is the daughter of a clinically diagnosed TB case. She has no signs or symptoms of TB. Her TST is 12 mm.

If the index case was bacteriologically confirmed instead of clinically diagnosed, would Vicky be eligible for IPT?

3. Debra, 29/F, tested positive for HIV at the treatment hub. She has no signs and symptoms of TB, but her X-ray showed infiltrates in left upper lobe consistent with TB. She had no previous treatment for TB.

4. Mark, 25/M, is a diagnosed HIV patient. Upon diagnosis he underwent a chest X-ray, which was normal. He has no signs or symptoms of TB.

Note: These are the same questions in Exercise #3.1 that can be answered online. Exercise # 3.1A is the alternative offline version.
